

Table 1: Simulation results

	N=20	
	Percentage of success in 100 runs	Elapsed time to complete experiment (secs)
a) Basic Hill Climbing	1%	7.826
b) Random Restart with k=10	20%	95.833
b) Random Restart with k=100	89%	519.520
c) Stochastic Hill climbing	3%	18.151
d) Enter your short summary	Random restart with k=100 clearly outperformed other methods with 89% success rate. Both basic and stochastic hill climbing struggled significantly, getting trapped in local optima with minimal success rates.
